

Apple Announces Time Machine 2.0

for immediate release

Want to know how things turn out? Need better information about your company's financial picture six months from now? Curious about stock-market performance next quarter ... or next year? Wonder whether your significant other will enjoy the surprise you are planning? Developers: Want to know how you are going to fix that bug?

Apple today announces a new version of Time Machine, the highly successful and popular file-archiving and recovery application first introduced with Macintosh OS X 10.5, "Leopard". Thanks to innovative use of thiotimoline-based layers in new processor fabrication technology, **Time Machine 2.0** allows *recovery of files from the future* as well as from the past.

In previous product announcements, all we could honestly say was that we anticipated or expected great things from our innovations. Now, thanks to what Steve Jobs will call "this insanely amazing new technology", we can state with certainty, based on our own future corporate records, that **Time Machine 2.0** will revolutionize a vast variety of human activities, including everything from finance to international relations, from marketing to estate planning, from law to love. Our market surveys taken during the next five years show that **Time Machine 2.0** will be the most successful Apple software release ever.

In fact, our preliminary sales receipts for next quarter show that you are going to buy a copy soon, and we already have the credit card number and authorization that you will provide. So don't delay -- order **Time Machine 2.0** today.

We **know** you're going to love it!

[System requirements: Intel or PowerPC Macintosh with at least 2 GByte of memory and 300 MByte of free disk space, running Macintosh OS X 10.7 "TabbyCat" or later.]
